## What is a DAMAS Dental Laboratory?

DAMAS is the 'Dental Appliance Manufacturers Audit Scheme'. It is a quality management system designed specifically for the manufacturers of custom made dental appliances.

DAMAS is the most commonly used annually inspected quality system within the dental laboratory industry that provides a framework for an effective quality management system which enables dental laboratories to prove to their clients that they are operating within the law (Medical Devices Regulations MDR).

DAMAS is more than just a quality control mechanism. It encompasses control beyond just inspection and testing and requires a structured approach to prevention of quality problems through planned activities that include reviews, monitoring and documentation.

DAMAS provides laboratories with a set of processes that ensure a common sense approach to the management of the organisation. The system ensures consistency and improvement of working practices, which in turn should provide products and services that meet customer's requirements.

Bremadent Premier (Bristol) LTD is an Accredited DAMAS Dental Laboratory.

## **NEW!** Full Contoured Zirconia Crowns

We are proud to announce that we will now be offering CAD/CAM Milled Full contoured solid Zirconia crowns in traditional Vita & bleach shades which can be used for crowns, bridges, veneers, inlays/ onlays and screw retained implants crowns .

This is a cost effective solution to Full Metal / Gold Crowns as there is no alloy charge and is tooth coloured restoration that is ideal for bruxists due to its high flexural strength (650 -1200 mpa) and little inter occlusal space (0.6mm minimum) whilst maintaining minimal wear on opposing dentition.

*Contact Kash and ask him about 'how to sell Valplast' to patients or for a presentation in your practice call: 0208 520 8528 for more info*

## CoCr Dentures – 'The Gold Standard'

Chromes are still the 'gold' standard in partial prosthetics. At 1-2 mm thickness and various major connector designs, from skeletal to full plate and lingual plate to sub-lingual bars, the design's are endless. Clasp design with the RPI (mesial rest seat, plate, i bar clasp) system is favourable on free - end saddles due to the distribution of the vertical applied forces which stops crown movement distally and minimizes the risk of damage to the periodontum and teeth.

Chromes are designed to be easily adapted and biocompatible whilst providing the patient with optimum comfort, function and hygiene. Chrome framework design is based on minimizing risk of damage to the teeth and periodontum via major connectors placed 3mm away from gingival margin. Clasps are added for retention and to resist displacement away from the oral tissues, whilst the lateral displacement during function is controlled via reciprocation and bracing. By having all of the features above incorporated into a partial it provides a stable chewing experience for the patient.

All chrome partials are surveyed with all undercuts blocked out. This provides a simple path of insertion. <http://www.bremadent.co.uk/cobalt-chrome-cocr>
